Radiator Coolers

These Norwegian Heating and Cooling Coils are designed for industrial and marine applications. Our unique knowledge on how to move heat between air and liquids has been our core profession since 1967.

Our heat exchangers will be designed to meet your specifications and we will make sure they will give you the required capacities.

- Seawater coils
- Fancoils (room coolers)
- Radiators (to motors and generators)
- AHU coils / duct mounted coils
- DALC/condensors/evaporators (safe/haz)
- EL-heating coils (safe and hazardous area)

With several material combinations, we can optimize the corrosion protection. Standard coil is cu/al/galvanized - alternatives are with CuNi, AISI316L, titanium and much more.

When designing the exchanger, we ensure effective air heating with electricity, hot water, steam or oil - eventual cooling with seawater, ice water or other cooling media.

Since we introduced titanium coils in the 1990's we have supplied most of the titanium coils for seawater systems on Norwegian oilfields.

Every year we design and produce several thousand unique exchangers for projects around the world. They are made for purpose and will perform perfectly for decades. TTC exchangers are supplied worldwide. You'll find our mail/phone on top of this page. We are looking forward to assist you.

Heat exchangers designed and produced since 1967
