TTC Dry Coolers - All you need from one supplier

TTC Norge is a modern and competitive company within heat exchanger technology. The Norwegian production unit was established 1966 and we are one of few producers in Scandinavia with a complete range of air to liquid heat exchangers.

Optimized DALC flatbed and V-coolers

For the calculation of a dry cooler that fit each process perfectly, we have developed an automatically optimizing program for the unit design. With noise limitations, max liquid pressured drop, unit dimensions, material selection and required redundancy, we can identify and optimize the dry cooler for your project.

TTC Dry Coolers can handle an endless number of temperature combinations and power. The coolers are perfect for sites requiring reliable operations and low noise.

New!

Multiple material combinations

Basic material combination is cu/al/galvanized. Alternatives could be aluminium alloys or with surface protection. If these alternatives are not sufficient, we also produce with SS316 or titanium.

Tell us which capacities you need - and we will introduce you to the perfect dry cooler for your project - with all you need in one package.

Other air cooling or heating products from TTC Norge:

Produced with required capacity and dimensions since 1967
